

Pegasus Interoperability Data Receiver

[Administrator Documentation](#) - [User documentation](#)

Introduction

This document is intended for Pegasus Gateway Administrators and describes the requirements needed in order to upload data from external platforms to Pegasus servers.

Once the data is uploaded it will be available in the API to query and visualize in the Application.

Requirements

In order to start receiving data Pegasus Owners will need to follow these 2 steps:

Step 1

- A JSON receiver needs to be activated on your gateway, [contact DCT](#) in order to enable it

Step 2

- The device IMEI needs to exist in your gateway, [contact DCT](#) in order to add the device IMEIs

Once you have completed the steps above, you can replace the contents of the **Requirements** section in the [Pegasus Interoperability Data Receiver](#) document.

API Description

Endpoint: **RECEIVER_FROM_ADMIN_STEP_1**

(example: <http://pegasusXXX.pegasusgateway.com:40000/json>)

Method: **POST**

Headers: **Content-Type: application/json**

Body: **ARRAY_OF_EVENTS**

From that point forward a developer should be able to send data to your Pegasus Gateway *from any authorized device* / IMEI included in that particular gateway database.
